

# IoT-enabled Grid Monitoring and Management System for Enhancing EV Charging Efficiency in Residential Applications

## Project Group 08

Mohamed Haneen : TVE21EE088  
Muhammed Shehin S : TVE21EE092  
Neha V K : TVE21EE096  
Sriram M : TVE21EE123

Under the Guidance of  
Prof. Sohan Placid John, Assistant Professor

Dept. of Electrical and Electronics Engineering  
College of Engineering Trivandrum

# Outline

- 1 Introduction
- 2 Objectives
- 3 Implementation Strategy
- 4 Benefits
- 5 What we intend to achieve
- 6 References

- The number of electric vehicle (EV) users in India is rapidly increasing at a rate of 35% year-on-year.
- This surge in EV users can significantly impact the power distribution grid, leading to increased load, grid congestion, voltage drops, and reduced power quality.
- For our project, we plan to focus on developing an Enhanced system for addressing this potential issue.

# Objectives

- Develop a system for real time data collection and analysis.
- For this, Smart energy meters are required.
- But, immediate transition to smart meters require huge financial investments for developing countries like India.
- Alternative Approach: Upgrade existing digital meters with additional circuitry.

# Implementation Strategy

Figure: Proposed Model

# Benefits of Upgraded Digital Meters

- Cost Efficiency
  - Minimizes initial investment compared to full smart meter deployment
- E-Waste Reduction
  - Utilizes existing infrastructure, reducing environmental impact
- Enhanced Functionality
  - Enables real-time monitoring and data analytics capabilities
- Integration
  - Supports future scalability and compatibility with advanced grid systems

# What we intend to achieve

- An IoT Based module for real time data acquisition from existing energy meters.
- A data analysis and management system for monitoring EV charging usage.
- A dynamic pricing model for regulating EV charging.
